PHYSICS 3204
CURRENT ELECTRICITY

| Electron Flow | Electrons flow out of the ( - ) terminal into the $(+)$ |
| :---: | :---: |
| CURRENT | $\begin{aligned} & I=\frac{Q}{t} \\ & \mathrm{I}=\text { current ( ampere, A) } \\ & \mathrm{Q}=\text { charge }(\text { coulombs, } \mathrm{C} \\ & \lambda=\text { time }(\mathrm{s}) \end{aligned}$ |
| AMMETER | Instrument used to measure current. Ammeter is connected in series with the other elements of the circuit. |
|  | $\begin{aligned} & V=\frac{E_{e}}{q} \\ & \text { V= voltage (Volts, V) } \\ & \left.\mathrm{E}_{\mathrm{e}}=\text { Electric Potential Energy ( } \mathrm{J}\right) \\ & \mathrm{q}=\text { charge (Coulombs, C) } \end{aligned}$ |
| VOLTMETER | The instrument used to measure voltage. |
| ELECTRIC ENERGY | $\begin{aligned} & E_{e}=\text { VIt } \\ & E_{e}=\text { Electric Potential Energy ( J) } \\ & V=\text { voltage or potential difference across the circuit (Volts, V) } \\ & I=\text { current flowing through the circuit (Amperes, A) } \\ & t=\text { time that the circuit is being used ( seconds) } \end{aligned}$ |
| OHM'S LAW: measures "resistance" to electron flow. | $\begin{aligned} & R=\frac{V}{I} \\ & \mathrm{R}=\text { resistance }(\text { Ohms, } \Omega) \\ & \mathrm{V}=\text { Voltage }(\text { Volts, } \mathrm{V}) \\ & \mathrm{I}=\text { current }(\text { ampere, } \mathrm{A}) \end{aligned}$ |
| OHMIC CIRCUIT | when V versus I results in a straight line, the resistor has a constant resistance. Such resistors are said to be ohmic because they obey Ohm's law. |

| FOUR FACTORS THAT AFFECT RESISTANCE: | 1) increases in resistance as its temperature rises <br> 2) longer the wire, larger the resistance <br> 3)Resistance is inversely proportional to the cross-sectional area of the resistor $\begin{aligned} & \frac{R_{1}}{R_{2}}=\frac{L_{1}}{L_{2}} \\ & \frac{R_{1}}{R_{2}}=\frac{L_{2}}{L_{1}} \end{aligned}$ <br> 4)Resistance is affected by the substance that makes up the resistor. ( See Resistance of Conductor below) |
| :---: | :---: |
| RESISTANCE OF A CONDUCTOR | $\begin{aligned} & R=\rho \frac{L}{A} \text { or } R=\rho \frac{L}{\pi r^{2}} \\ & \mathrm{R}=\operatorname{resistance}(\mathrm{Ohms}, \Omega) \\ & \rho=\text { resistivity }(\Omega \mathrm{m}) \\ & \mathrm{L}=\text { length }(\mathrm{m}) \\ & \mathrm{A}=\operatorname{Area}\left(\mathrm{m}^{2}\right) \end{aligned}$ |
| KIRCHOFF'S CURRENT RULE: | current going into a junction point equals the current leaving the junction point. |
| KIRCHOFF'S VOLTAGE RULE: | $\begin{aligned} & \text { - Series (single loop) } \mathrm{V}_{\mathrm{T}}=\mathrm{V}_{1}+\mathrm{V}_{2} \\ & \text { - Parallel (in every loop) } \Sigma \mathrm{V}_{\text {rise }}=\Sigma \mathrm{V}_{\text {rdrop }} \end{aligned}$ |
| TOTAL RESISTANCE IN SERIES | $\mathrm{R}_{\text {тотаL }}=\mathrm{R}_{1}+\mathrm{R}_{2}+\mathrm{R}_{3}+\ldots$ |
| TOTAL RESISTANCE IN PARALLEL | $\frac{1}{R_{\text {TOTAL }}}=\frac{1}{R_{1}}+\frac{1}{R_{2}}+\frac{1}{R_{3}} \ldots$ |
| POWER | $\begin{aligned} & P=\frac{W}{t} \text { or } P=I V \\ & \mathrm{P}=\operatorname{power}(\mathrm{W}, \text { watts }) \\ & \mathrm{W}=\text { work }(\mathrm{J}, \text { Joules }) \\ & \mathrm{t}=\text { time }(\sec ) \\ & \mathrm{I}=\operatorname{current}(\text { amperes, } \mathrm{A}) \\ & \mathrm{V}=\operatorname{Voltage}(\mathrm{V}) \end{aligned}$ |
| ENERGY | $\mathrm{E}=\mathrm{P} / \mathrm{t}$ <br> To find the cost of your light bill be sure to leave units as kW 。hr |
