

ELECTRIC FIELDS (ELECTROSTATICS)

UNIT 2- SECTION 1

PHYSICS 3204

- An electric field is a region in space that affects charge, and causes the electric force on a test charge placed inside the electric field. Electric field are graphically represented by lines of force

- 2 methods to charge an object 1) conduction 2) Induction
- The materials towards the top of the “Electrostatic Series” have a poor attraction for electrons.
- Understand the charge on an electroscope (and instrument used to detect the presence of a net charge on an object).
- The charge on an electron or proton is $e = 1,602 \times 10^{-19} \text{ C}$.
- Know how charge is distributed on objects,

This picture suggests that electrical discharge is more likely to occur from places of high curvature (i.e., pointy places).

- Determining Charge

$q = Ne$

- q is the charge (coulombs)
- N = is the number of electrons in excess or deficit
- e is the charge on the electrons $1.602 \times 10^{-19} \text{ C/e}$

- Common Electric Field Configurations

The electric field in the vicinity of two opposite charges

The electric field in the vicinity of two negative charges

- Look over the Laws for Electric Field Lines

- Below are a list of formulae that can be used in electrostatics:

<p>Coulomb's Law (The electrical force between two objects)</p> <p>positive = repulsive force negative = attractive force</p>	$F_e = \frac{kQ_1Q_2}{d^2} \quad (\text{unit: N})$ <p>$k = 9.0 \times 10^9 \text{ N}\cdot\text{m}^2/\text{C}^2$ (Coulomb's constant)</p>
<p>Electric Field Strength (\vec{E})</p> <p>Sign indicates direction of the field</p>	$\vec{E} = \frac{F_e}{q} \quad (\text{unit: N/C})$ <p>or</p> $\vec{E} = \frac{kq_m}{r^2} \quad (\text{for the main point charge})$
<p>Electric Potential Energy (E_e):</p> <p>The work done to move a charge in an electric field</p>	$E_e = \frac{kq_m q_t}{r} \quad (\text{unit: J})$
<p>Electric Potential (V)</p> <p>The potential energy per unit charge</p>	$V = \frac{E_e}{q} \quad (\text{unit: J/C or Volts})$ <p>or</p> $V = \frac{kq}{r}$
<p>Potential Difference (ΔV)</p> <p>The change in electric potential</p>	$\Delta V = \frac{\Delta E_e}{q} \quad (\text{Unit: Volts})$
<p>For a Parallel Plate</p> <p>Electric Field Strength</p>	$E = \frac{v}{d} \quad (\text{Unit: N/C})$

electron-volt (eV)?

1eV = 1.602 x 10⁻¹⁹ J
